

A CITY OF DIVERSITY

Exploring possible strategies for the water edge of Gothenburg

Edyta Świątek • Master Thesis MPARC • CHALMERS spring 2014 • examiner: Ana Betancour • tutor: Carl-Johan Vestlund

Abstract

The thesis reflects my interest and explorations into the complexity of the city of Gothenburg: the variety of people, background, cultures, urban everyday life, and the water edge. All of these aspects triggered my attention and became the framework for my thesis: to work with the water edge of the city aiming to design a public space, where multiple activities could happen by and for the citizens.

My research on the urban development of the central part of Gothenburg revealed strong tendencies of exclusion of some groups of people from the active participation in shaping and using public spaces, resulting in a shortage and a lower quality of a common ground in the city. The area of Skeppsbron, that is currently under development is a clear example of this tendencies. In my studies I encountered that the future plans for the area would lead to gentrification and exclusion instead of strengthening the possibility of a future network of public spaces.

The result of these investigations is a strategy aiming to increase the inclusive character of the public space of the waterfront in the city. An alternative plan for the area of Skeppsbron, trying to reconnect the city and the river, open and non-commercial public space for both local dwellers and citizens living at the suburbs – striving for urban diversity and flexibility, aspiring for an inclusive urban space for the city.

Therefore, a wide variety of example of activities are also suggested, and the design of the urban space concerned with making an open space for interaction and possible multiple uses, responding to the citizen's needs, necessary to raise the quality of the public spaces and places along the water edge. In my proposal I am trying to explore what architectural conditions would allow for such a complexity of spaces for a diversity of actors and activities to occur.

“ FLOWS OF THE PORT CITY.

PORT CITIES BUILD A NETWORK CONNECTING THE
WORLD. FLOWS OF PEOPLE, COMMODITIES AND
IDEAS ARE MOVING OVER THE OCEANS.

THIS CONTACT WITH THE WORLD HAS FORMED
GOTHENBURG AND THE HISTORY OF ITS PORT. (...)
THE MOVEMENT OF PEOPLE HAS CHARACTERIZED
THE CITY. SEAMEN, DOCKERS, EMIGRANTS AND
MERCHANTS – SOME COME TO STAY, OTHERS TO
MOVE ON.”

Gothenburg has a multicultural history-the city was founded by the Swedish king Gustav II Adolf as a port city. The port city situation has always favored cultural exchanges. It is not a new phenomenon that population of Gothenburg vary its ethnical background. Multiculturalism is part of its identity since 1621.

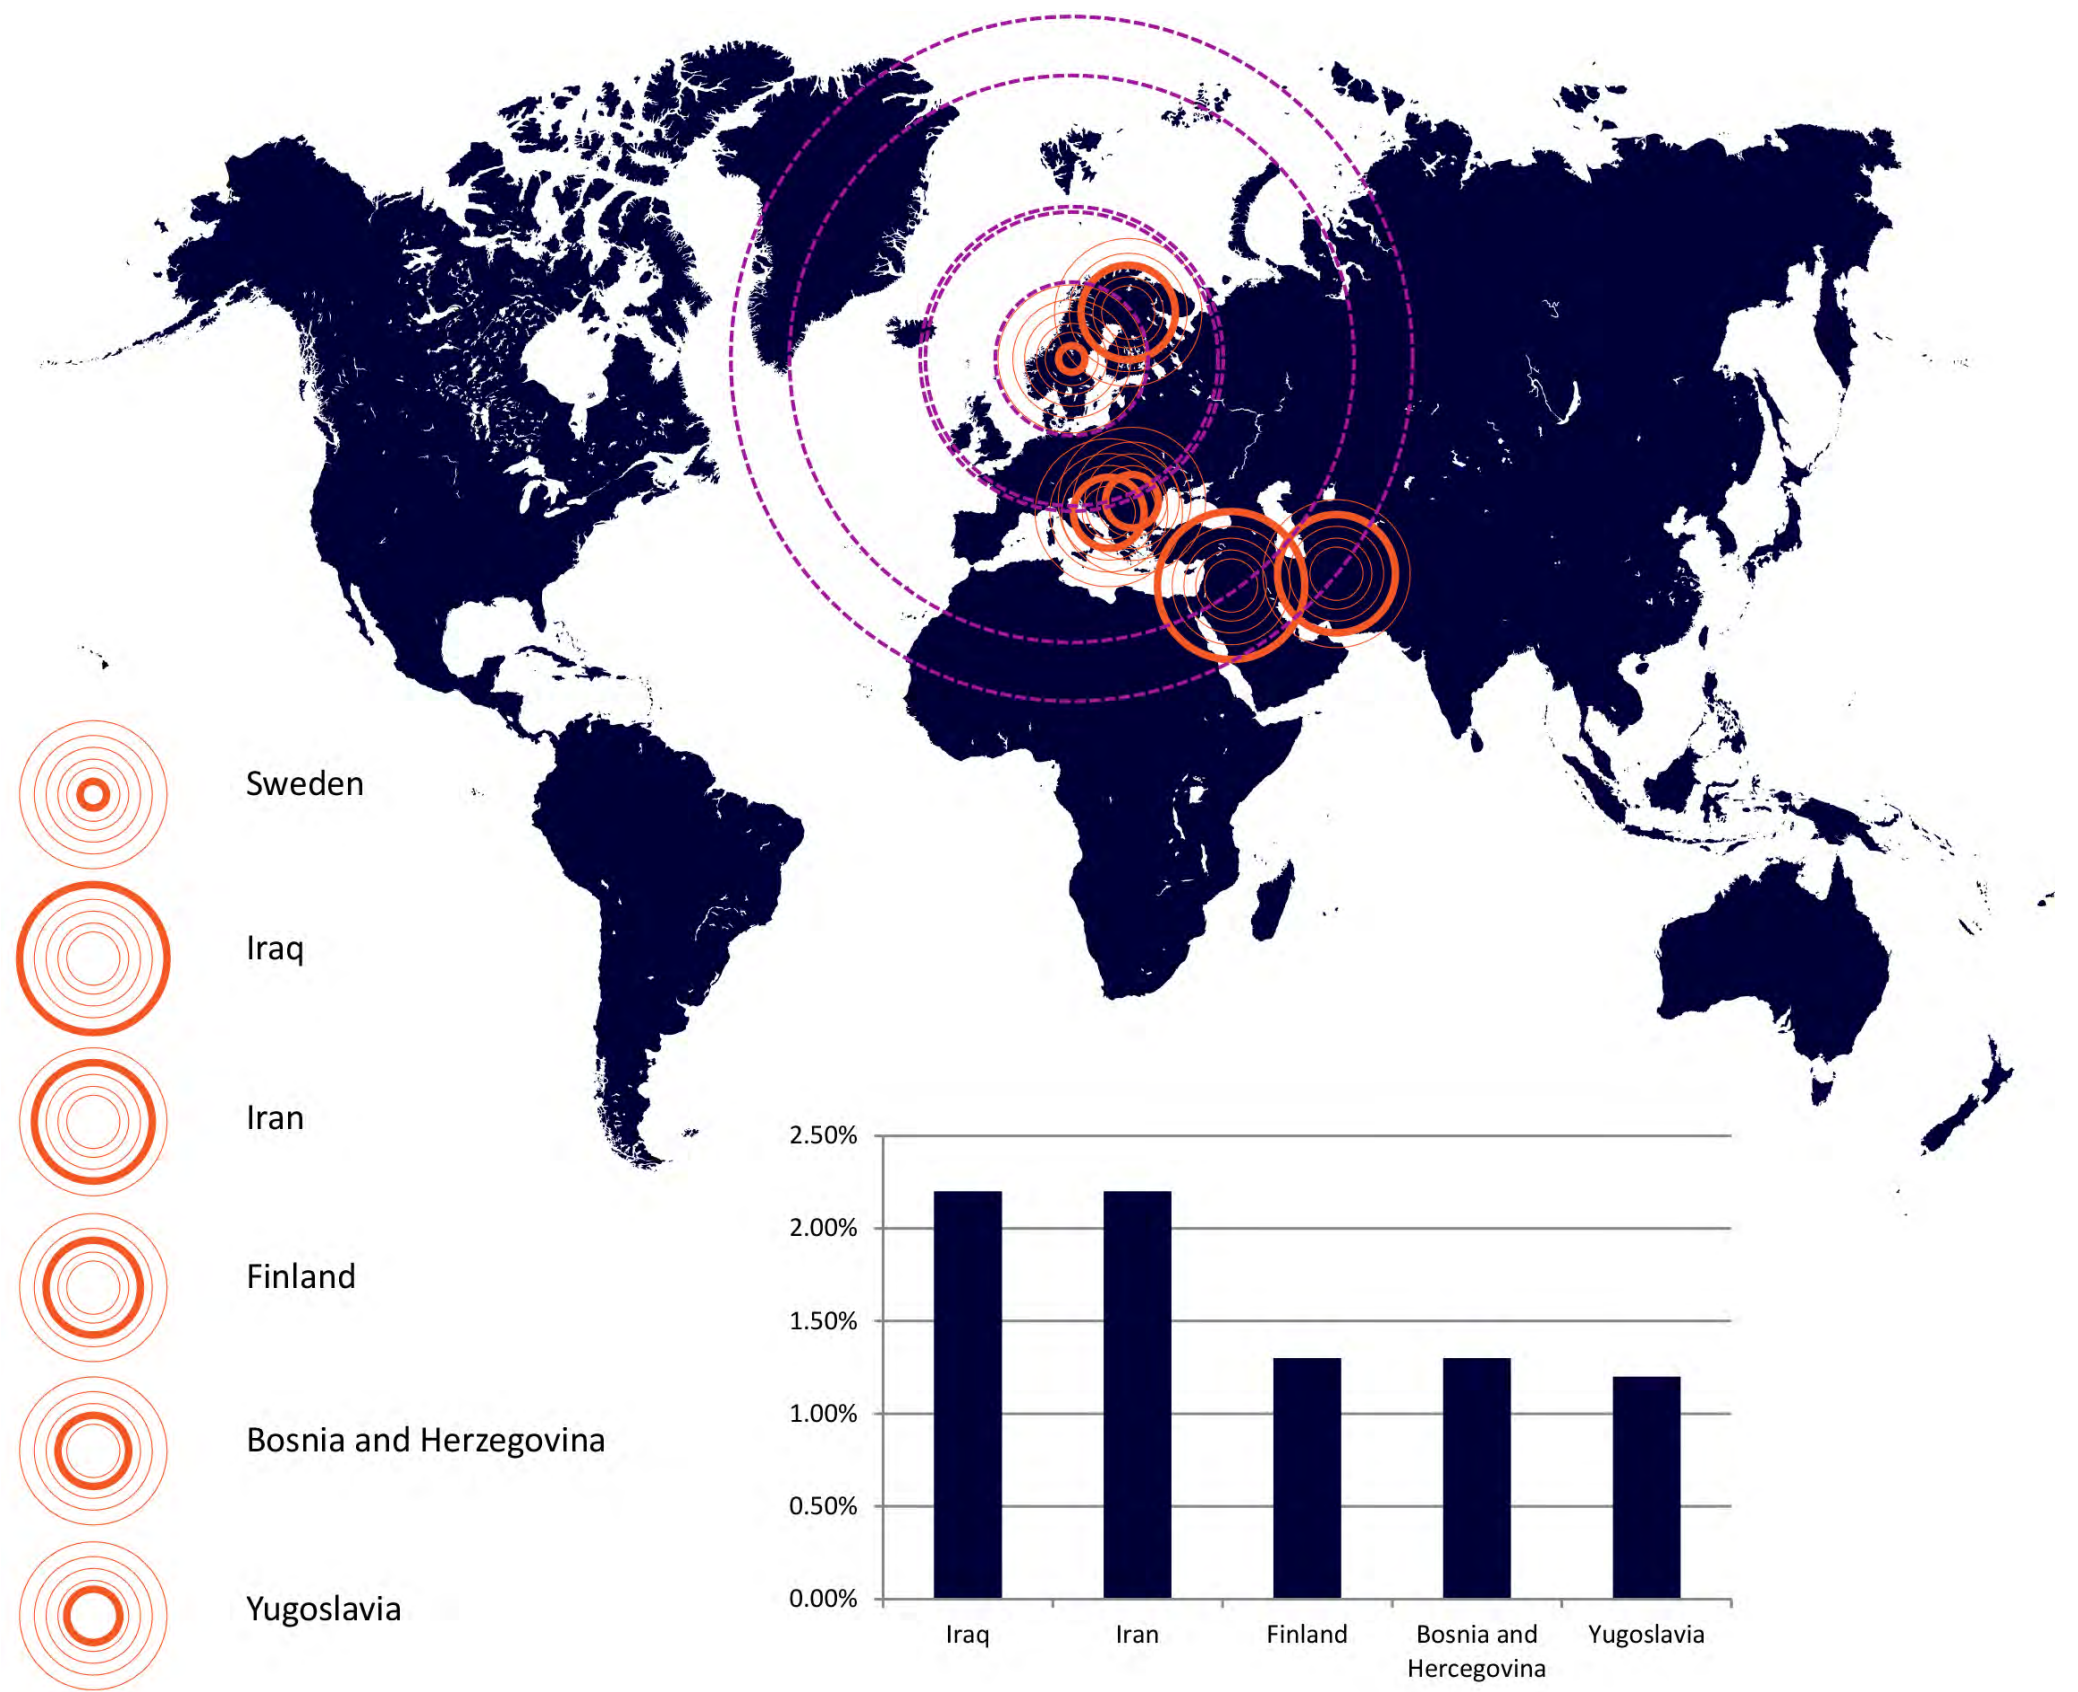

The map below comes from the Maritimes' museum collection. It was drawn in early XVII century. It shows connections between Sweden and places all around the world. Those contacts were possible thanks to the Swedish East India Company-which was the largest trading company in Sweden at that time.

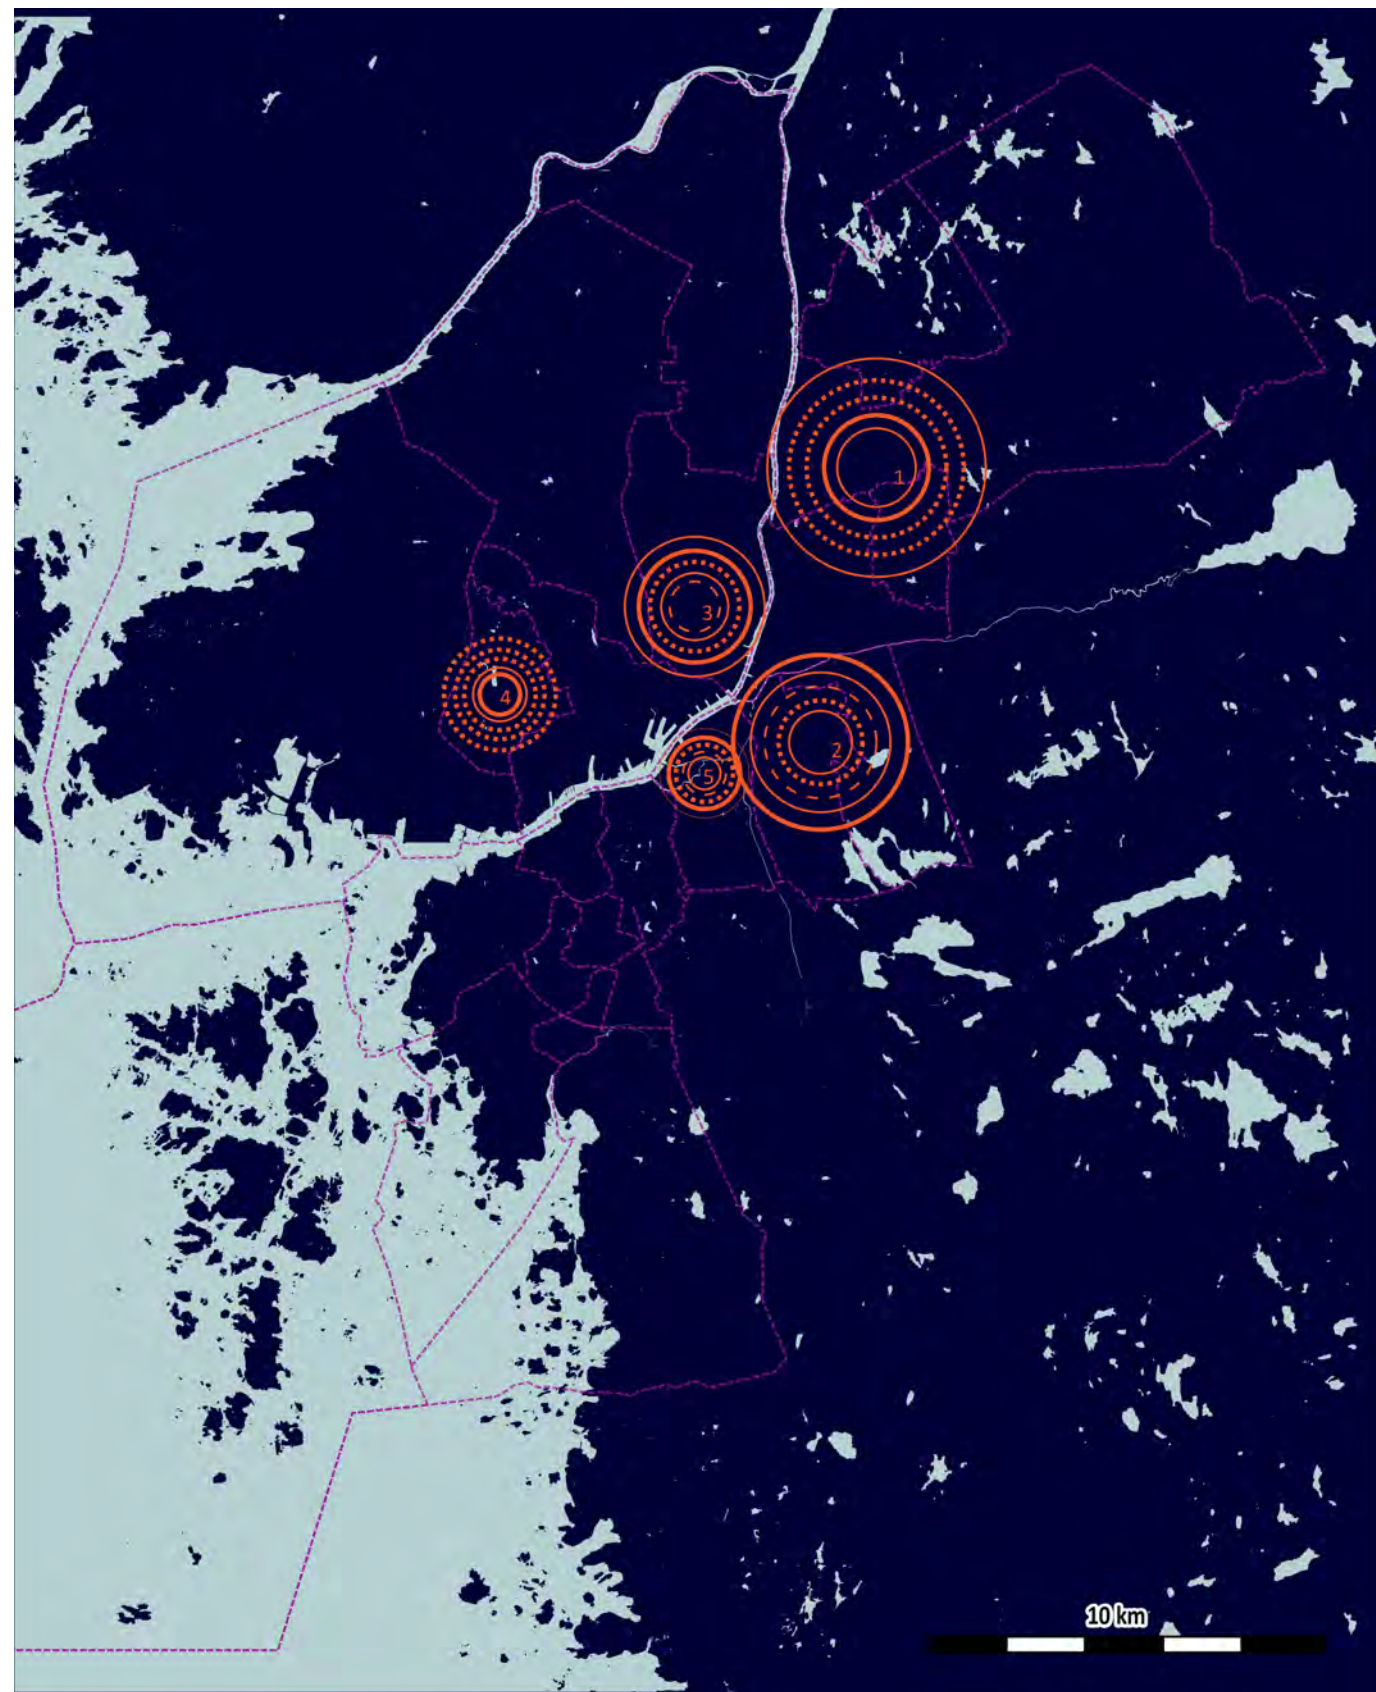

Nowadays, the multicultural background of the population of Gothenburg is shaped mainly by the immigrants, rather than seamen and merchants.

This lead to the study of main minorities of Gothenburg. In order to show the current situation a reverse map was drawn. The map is an answer for two questions: who are the main five groups of immigrants living in Gothenburg and how long distance they needed to cross to come here. The image shows 5 main most numerous groups, originally coming from Iraq, Iran, Finland, and terrains of the former Bosnia and Herzegovina and Yugoslavia. Just one minority account for 2% of the total population of Gothenburg.

Main minorities living in Gothenburg

In Gothenburg there are five main groups of immigrants. Every each circle corresponds to each of those five groups, according to the country of origin:

The type of the line, which creates the circle, corresponds to the number of population within a group.

The situation in the city of Gothenburg would be represented by the circles below.

The biggest minorities are Iranian and Iranian groups. In 2013 each group count 2,2% of the entire population of Gothenburg. The second is group of immigrants from Finland and Bosnien-Herzegovina (1,3% each). The amount of Yugoslavien immigrants is equal 1,2% population of the city.

The map is tracing five areas of focus, representing the factor of its multiculturalism by the size of the radius of the circles.

The mapped areas:

1. Angered (Angered, Bergrum, Gunnared)
2. Östra Göteborg (Bergsjön, Kortedala)
3. Norra Hisingen (Backa)
4. Västra Hisingen (Biskopsgården)
5. Centrum

Next step was to trace where those groups are settling. The research shows that the most multicultural areas are at the suburbs of Gothenburg, while the city center remain Swedish domain. Those part are opposites of each others. They mostly do not share common features.

Research

SEGREGATION AND THE DISTRICTS

Proportion of population with non-swedish background per area

The non-Swedish background does not only include the first generation of immigrants but also people born in Sweden, whose both parents are not Swedish.

The statistics-especially the data from 2010 with an old administrative division- clearly states that segregation in Gothenburg is present.

The data shows that the most diverse cultural background is visible on the outskirts of the city, while the central part remains Swedish domain.
The central part does not represent the social composition of the city, neither the suburban one.

The data according to the new administrative division; years: 2010 and 2013

The data according to the old administrative division; year: 2010

SEGREGATION AND THE DISTRICTS

In order to reveal the conditions and possibilities offered by the public space in the city, a set of interviews was conducted. My research was considering both suburbs and the central parts of Gothenburg.

Margaretta, a social worker at Idee punkten, engaged in the activities and events happening at Biskopsgården - one of the Gothenburgs' suburbs :

The events, which are gathering all the inhabitants of the city usually are concerning matters like food or flea market - basic activities familiar to everyone.

Margaretta

Mosis

Mosis, capoeira trainer, renting a space for trainings at Culture house "200km" at Florunda:

There is not so many places to train capoeira
It will be nice to meet other people training it in other parts of the city and have a common place to practice.

Emma, an Gothenburger living in centrum:

There is any pleasant public space for youngsters in the center.
I see many of them hanging at Nordstand without even any intention of shopping.
They are just sitting there or walking around with no purpose.

Emma

The urban life at the suburbs is full of diverse activities. There are many events happening in the suburbs, which are not apparent in the center.

There are, for example, outdoor markets and carnivals. There are also several artists working in those areas, having very few possibilities to present their works for a wider audience.

How does the life at the outskirts look like for its inhabitants? To answer this question I am quoting the suburban dwellers. They are stating that there is a good sense of community and an opportunity to learn from each other's cultures.

(Two of those images comes with quotations. One is a photo exhibition about one of the Gothenburg's suburbs-Hammarkullen. People from the pictures were interviewed by the photographer Jens S.Jensen.

The other quotation is from a short movie produced by Nordost association to promote Northern-east suburban areas.)

"There was not the same ethnical mixture in my class in Katrinelund High School, which is nearby Ullevi. All my classmates were Swedish. I have noticed that I know things which are not so obvious for them. For example, during the geography lessons, they have been learning theory, which I had known from practice, since I have grown up in Hjällbo, with people from all around the world."

Sgal Hussein

The member of the Swedish National Boxing representation

"We were certainly not as dangerous as everyone thought. We had a damn good sense of community, and we stayed in touch for a long time too. (...) There was pretty much never any conflict in the group"

Gerard, one of the residents of Hammarkullen, the quotation from the photoexhibition's folder "Hammarkullen 40 years later" by Jens S Jensen

Visions of Gothenburg 2021

To take a step back I looked at the Gothenburg's city policies. Due to 400 years anniversary of Gothenburg establishment the municipality strives for changing the image of the city from industrial into a cultural hub.

In order to achieve that the municipality carries a debate with citizens about how do they imagine a better city and what kind of improvements does it requires.

A set of meetings and surveys represent the citizens' visions of the future development.

Some of the most commonly occurring issues raised by the participants were lack of culture hubs in the center and lack of leisure activities on the river bank.

Mostly the answers were emphasizing the need of developing and improving common goods, available for all inhabitants.

“SCANDINAVIAN CITIES WERE BECOMING INCREASINGLY MULTICULTURAL, YET THE CONSEQUENCES WERE GENERALLY NOT MENTIONED IN THE POLICIES AND PLANS FOR SUSTAINABLE DEVELOPMENT.”

H.BJARNADÓTTIR AND K. BRADLEY, 2003

TOP DOWN STRATEGY

Nowadays the development of Skeppsbron is mainly driven by economical advantages from the taken decisions. The social, cultural and enviromental factors are neglected.

In order to trace possible reasons why certain actions were taken I have folowed the main actors involved in the change. Then it becomes clear that the current transformation leads to exclusion of the spot from the chain of public spaces. The heterogenity of the space was caused by the decisions taken by the heterogeneous group of people: the actors represents mainly Swedish middle class. It leads my investigation to another groups of actors, who might be intrested in utilizing the space and simultaneously create interesting heterogeneity.

My intention was to change the space at Skeppsbron into more public, complementary and balanced by making it welcoming and appealing for all citizens. This type of intervention leading to the extension of the open public spaces is highly needed in the cities like Gothenburg, where we can observe a shortage of those kind of places.

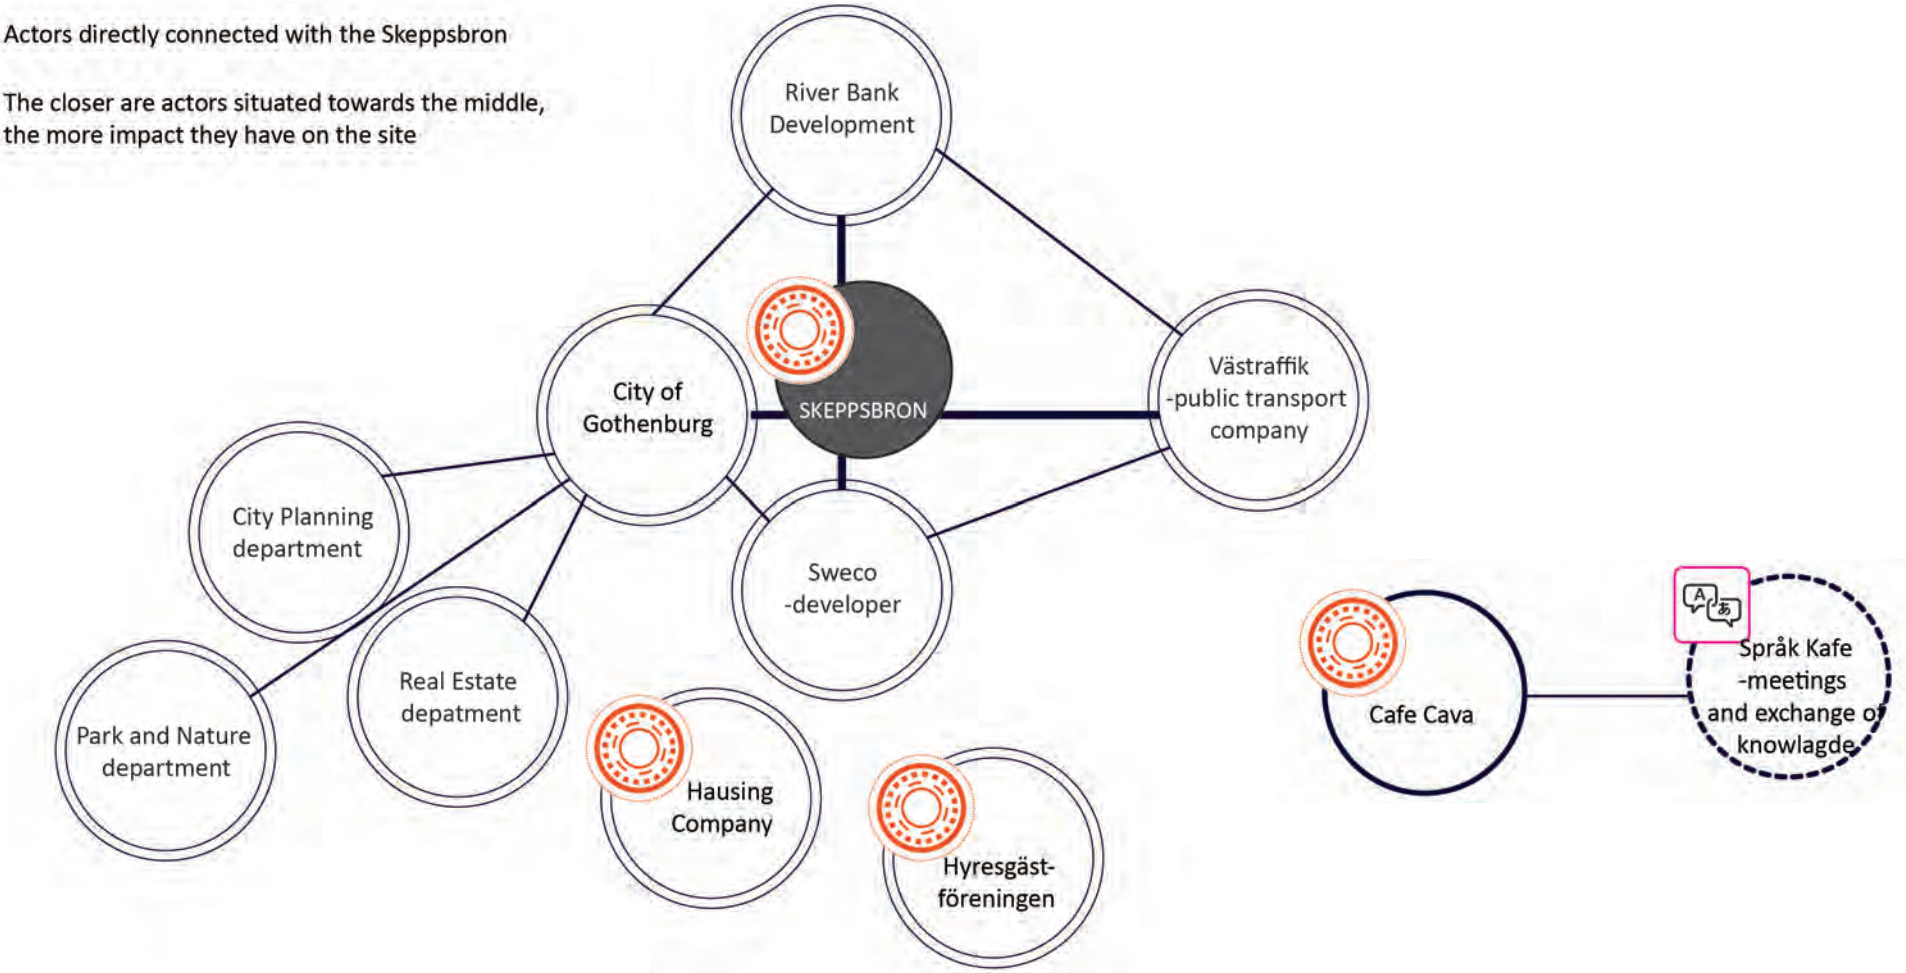

Municipalities' plans:

The new development is focused now on implementing the communication hub, hotels, housing units, restaurants, and a landfill in order to create the peers.

The transformation is conducted in two phases, illustrated by the diagram.

- first row of images represents the situation before the changes
- second row of pictures explains the first phase. The site is currently under construction. The focus is placed on implemen-tation a new ferry station at Stenpiren and tram and bus hub nearby. The bus line is moved from the bank of the river to-towards the city.
- the second part of transformation includes construction of new exclusive housing units with restaurants and shops at the bot-tom floor. The parking boat will be moved. The extension of the shoreline will be executed by filling the water with the ground. It might be problematic in the area already under the flooding risk.
- due to the global warming and general raise of water the area might be completely flooded within 200 years. The last images represents possible scenario.

Colours on the bar refers to the colours onthe diagram and place those images on the imeline of the reansformation of the site.

Actors - legend

Actors, related to the specific district in the city

The mapped areas:

1. Angered (Angered, Bergrum, Gunnared)
2. Östra Göteborg (Bergsjön, Kortedala)
3. Norra Hisingen (Backa)
4. Västra Hisingen (Biskopsgården)
5. Centrum

Types of actors

Connections between the actors

Collaoration between the actors - current situation

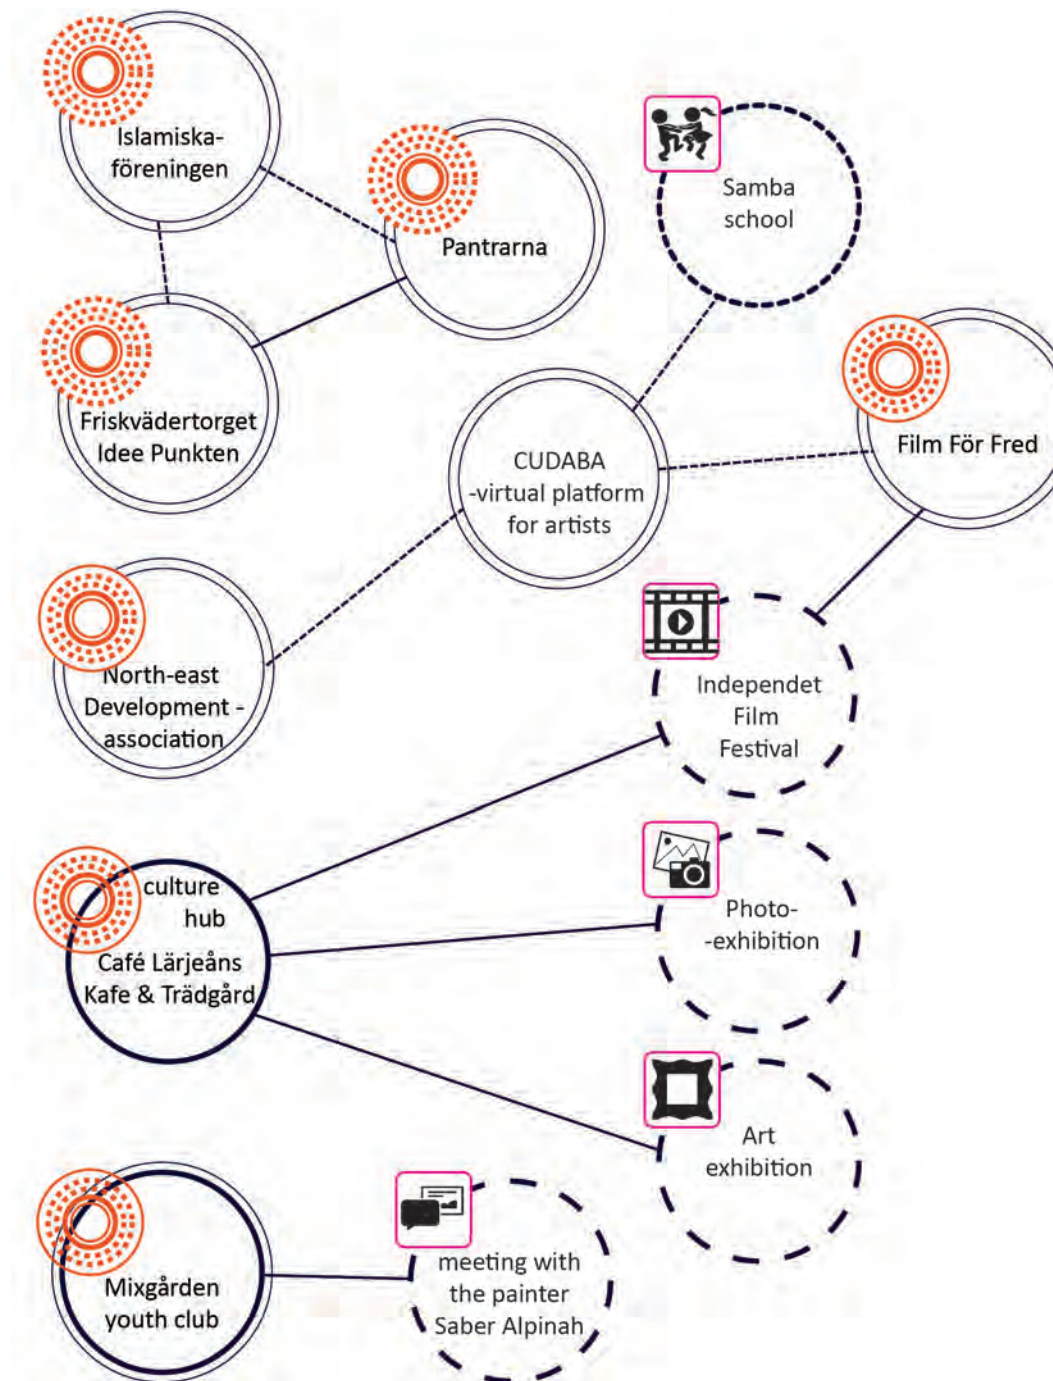

Collaoration - which is planned to strenghen or create

Types of programmes - division according to the duration

Actors, who might be interested in beeing more active on the site

By conducting interviews and observations I was exploring the diversity of people with different backgrounds and cultures. Very often artists are active in one of the suburbs and are not apparent in other districts of the city. I believe that providing them common ground to present their work in the city center could tie different parts of the city together.

ACTORS AND PROGRAMES

Following the different groups of people and associations I have noticed that currently suggested program do not respond to the needs of the people.

Therefore I have accumulated the programs which might be appealing for a wider scope of citizens.

I believe that the Skeppsbron area have a capability to host all of them and even more. Not all the usage of the public place can be overseen well in advance. That is why the spaces giving the conditions for many activities works like catalists for things to happen.

In order to rise citizens' inters in the site I have planned three strategies to attract them. The first is to introduce the programs already popular in other parts of the city. Second is to expand and support sugestions and visions for this site made by an activist. The third one is to add programs which are possible to carried on once the conditions for the previous activities are created.

To collect the data I have conducted a set of visits to popular public spaces, culture houses, local libraries and by observing people spending their time.

The observations were carried in Gothenburg.

At the following page I have marged the set of programmes for Skeppsbron with already registered in Gothenburgs' media cases. The programs conducted at Skeppsbron-as I have planned-would strengthen already happening events.

Catalog of programs

	Programs existing/according to the first strategy activities accried out by the minorities	Planned to introduced directly on the side/ according to the second strategy:proposed by ICIA	Possible programs (suggested by me)/ possible to indroduced due to the flexible structure -according to the third strategy
Come and experience	 Films projectiojns	 Art performance	 Reading for public-in public
	 Photo exhibition	 Bookstore with possibility of reading for free at the shop	 Fashion show
	 Art exhibition	 Lectures, seminars	 Alternative venue for events and festivals already carried on in the city
	 Lectures, seminars	 Training platform oriented towards curators	 Warm drinks 24h
Come and interact (with the others)	 Informal language lesson	 Art hotel	 Common dance tainings with groups from the whole city
	 Dance lesson	 Renting the working space among the other artists	 La parkour
	 Vernissage, meeting with the artisit	 Presenting produced artworks as the a form of the rent payment	 Meeting place for associations registered in Gothenburg
	 Food market	 Cafe, restaurant	 Comfortable enivironment for casual conversations
Come and express yourself	 Graffiti	 Presentations, debates	 Angry-notes' wall
	 Manifestations		 Peaceful manifestations of the ideas
			 Venue for debutants
			 Venue for young artists
Activities for children		 Activities for children every afternoon during 2-3 hours	 Snowman-building competition
	 Free homework help	 Free homework help	 Theater and performance workshops

This map shows that Skeppsbron is in a very central part of Gothenburg. The close proximity to the river is its main asset. To understand the urban context I conducted a set of analysis.

Programme layer

In terms of programs and activities the main meeting and culture hubs oscillate around Brunnsparken and Järntorget. The area become more homogenous towards the water. The Skeppsbron area, now underutilized, is far from taking advantage from its potential.

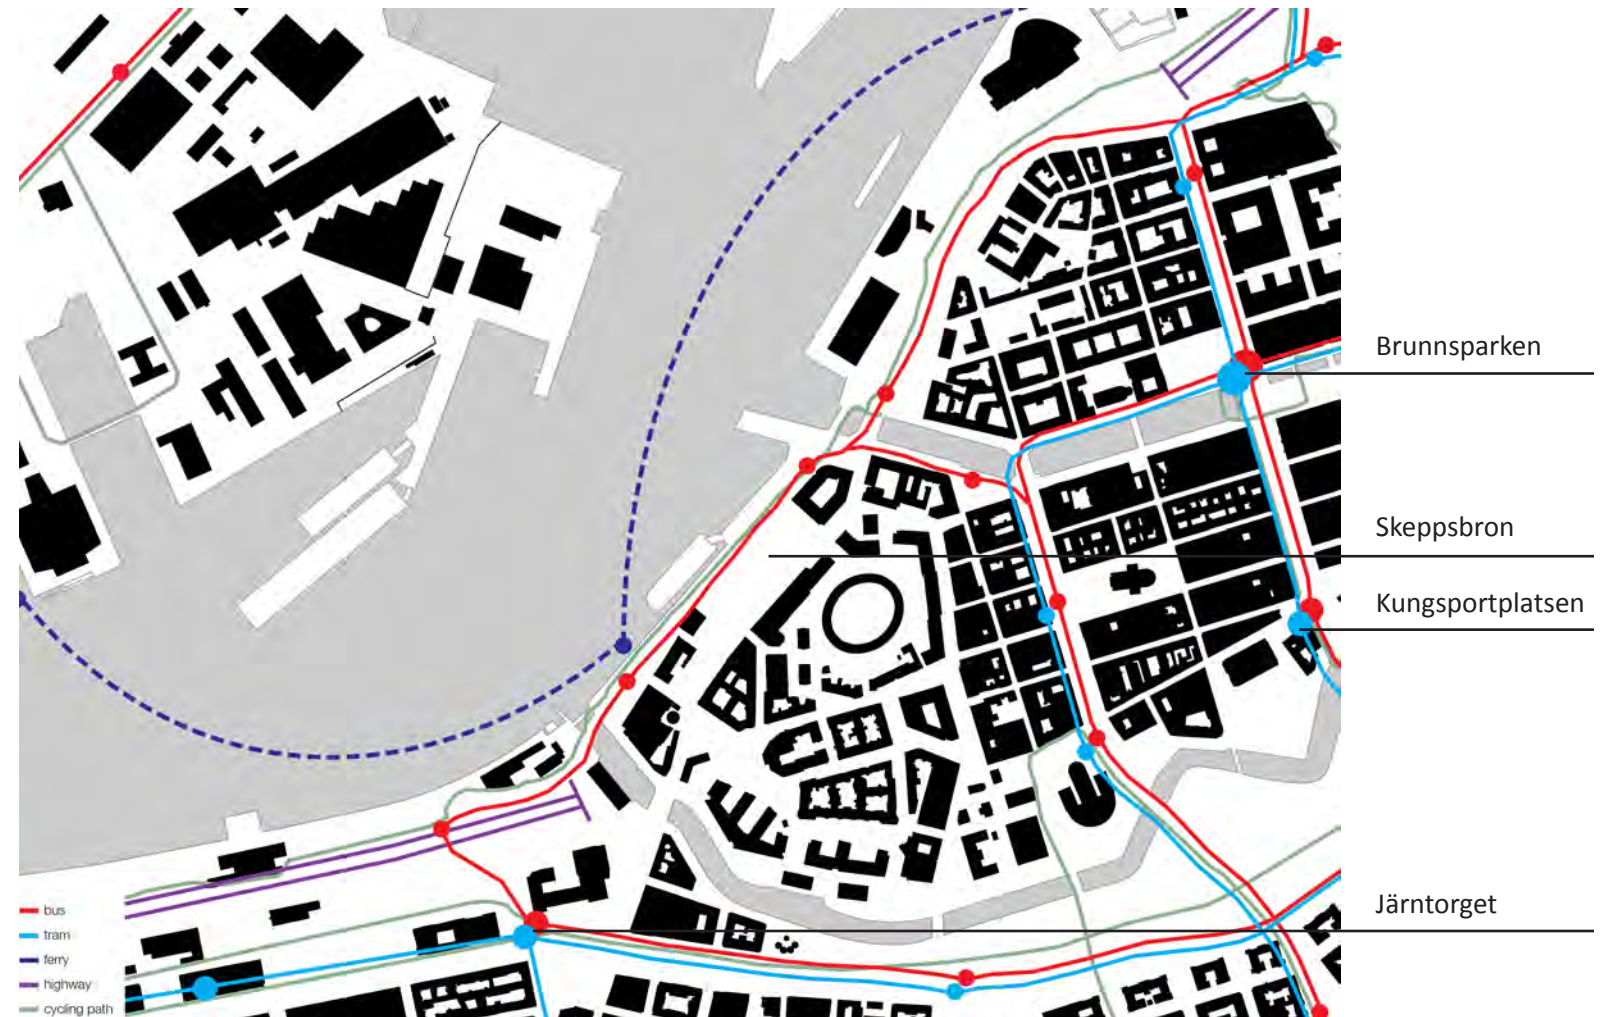

Natural conditions

The natural topography around Skeppsbron isolate the site from the rest of the city. There is also a green belt nearby with a commonly used walking path. The part of the belt along the channel is visible on the map. It continues up and around the old city walls, and stops just at the river bank.

Communication layer

In contrary, the site is a very well connected by the public transportation with the rest of the city. In a walking distance there are main communication hubs like: Brunnsparken, Kungsporsplatsen and Järntorget.

URBAN LANDSCAPE / ARCHITECTURAL PROPSAL

PROTOTYPES

The result of these investigations is a strategy aiming to increase the inclusive character of the public space of the waterfront in the city. An alternative plan for the area of Skeppsbron, trying to reconnect the city and the river, open and non-commercial public space for both local dwellers and citizens living at the suburbs – striving for urban diversity and flexibility, aspiring for an inclusive urban space for the city.

My architectural response to the presented situation is a spatial appropriation of the introduced area. I would like to create conditions supporting generosity of the public space at Skeppsbron. My design is a structure which expands the usable waterfront. The main characteristic of the expansion is that created piers are designed to be partly flooded. The hourly fluctuation of the river's level covers the structure more or less with the water during the day. Thanks to that it is possible to observe constantly changing shoreline. There is also a part of the structure which always remains above the flooded area. Some of the ever-dry parts are fixed while the others are floating and rising with the water level. In contrast to steep embankment present now on the side the structure provides gradual transition between the adjacent urban space and river edge. It allows the access to the water without a perceptibly hard borderline. In opposition to the planned landfill it reconnects with the natural assert of the side by creating the awareness of the rivers' dynamics among the local inhabitants. I believe that my intervention will be beneficial both for the local dwellers and citizens of Gothenburg in general.

In order to achieve that, while designing, I have decided to focus on three main aspects: building a new relation to the river at the river's edge, make the space more accessible and more flexible.

Main axis of the presented structure is a path along the river—an avenue. The avenue – which is traditionally a straight route with a line of trees or a large shrubs running along each side, which is used as its French source 'venir' (to come) to indicate, emphasize the 'coming to' or arrival at a landscape or architectural feature.

All the other tools are subservient to the main axis, and as the trees planted along the avenue are the most cases all the same species, the elements of my design appear as belonging to one family. I am building its complexity by multiplying few simple elements and grouping them in various configurations. It is in order to give the uniform appearance along the full length of the avenue. In my proposal I am using the avenue as a mean of connection between cultural venues along its track and as an element carrying a cultural value by itself.

Therefore in the prototypes I was trying to work with relation to the river edge, flooding and flexibility and accessibility of the spaces. I was trying to create a landscape with a path along the river. I have decided to create a structure of 11 piers and an avenue along all of them.

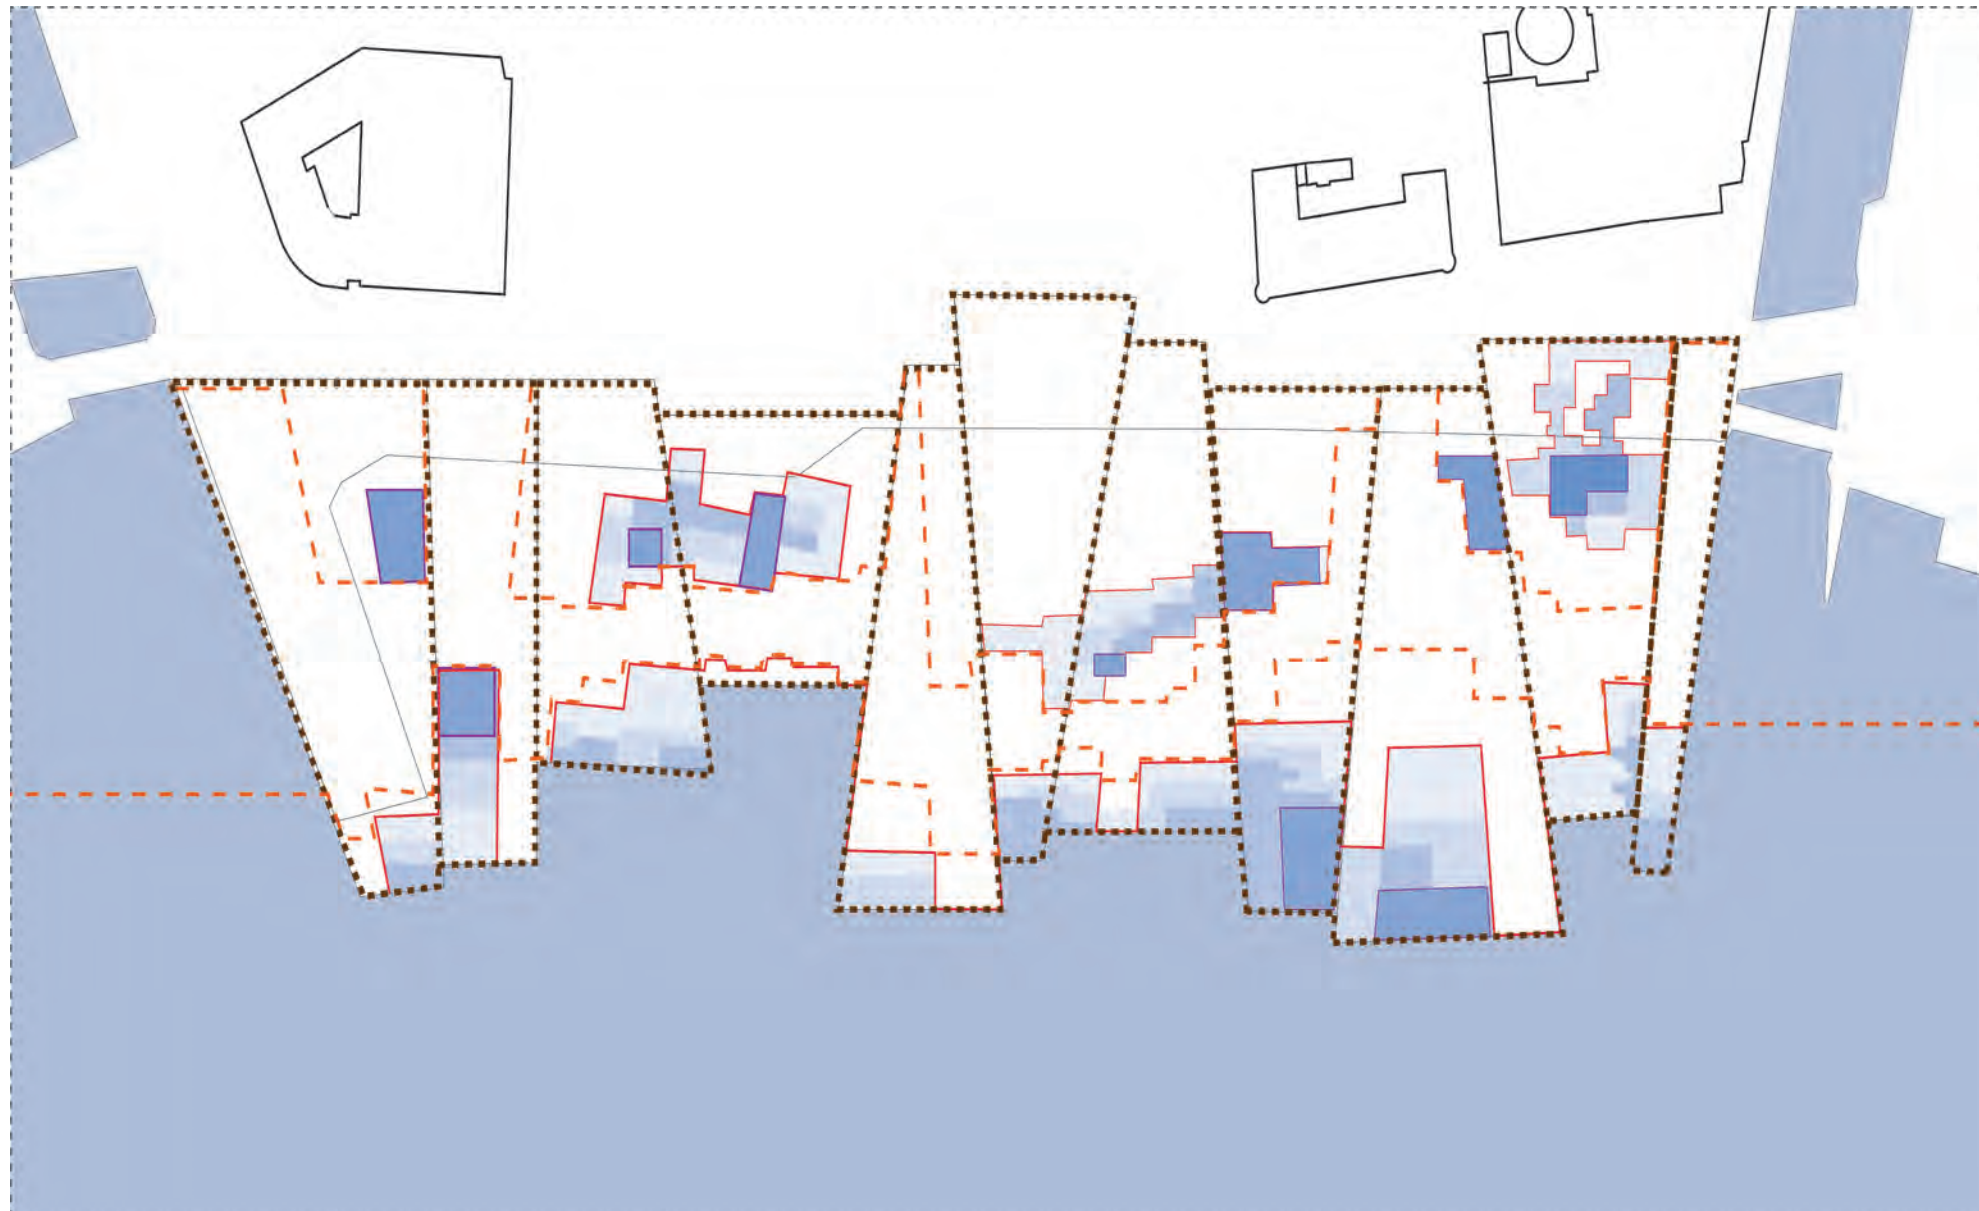

FLUCTUATION OF THE GÖTA RIVER

Exploring the spatial qualities of the river adjacent to the side, I have noticed that the water level constantly changes. The diagram registers constant changes of the water level. Yearly the difference between the maximum and minimum level can be even 1,40m, but daily it mostly vary between 30-60 cm.

I have decided to take advantage of this phenomenon. My structure becomes partly flooded. The changing water level is deciding about the shape of the shoreline and which parts are accesible and which are not.

The images represent different water levels and changing landscape.

The last image below shows the situation with the highest registered water level. The orange dashed line represents a border of the main path-an avenue. The path always remains dry. The outer edge of the avenue divides the area into two parts: the one more exposed to the water dynamics and the other part, more connected to the land.

1	2
3	4

- 1. Avenue:** Constantly dry Main axe of the structure, and main path along the river, mean of transportation
Remain dry
- 2. Border between main zones:** The outer edge of the avenue becomes the border between the area highly exposed to the influence of the flooding and the part more connected to the land
- 3. Shoreline**
- 4. Constantly wet areas**

5	6
7	8 </td

- 5. Frequently flooded areas
- 6. Areas dominated by nature
- 7. Leisure areas exposed to the sun
- 8. Easily accessible open space

9	10
11	12

9. Smaller places with a more intimate atmosphere: Not so easily accesible and quite often covers by water therefore not so often visited

10. Tools: tools which help to avoke previously mentioned ambient which later on becoe my spatial components

11. Main components per piers

12. Zones adjacent to the pavilions

Proposal

PAVILIONS

Creating zones I was trying to name the type of space and ambience. The avenue is the main axis of the structure - a mean of connection between different zones. In order to avoke mentioned ambience I have created a set of tools which later become spatial components of my design. There are 11 piers in total and each is dominated by one of the elements. Three of those piers are dedicated to three buildings: Passage for food facilities, Exhibition pavilion and communities' culture house. The different types of programs result from my research. I would like to employ the knowledge from different cultures into the final solution.

Passage for food facilities

The first building provides an opportunity to sell and share food. Food was always a mean of attracting and connecting people. There will be possible to purchase snacks from all around the world, and -during the common meal-exchanging knowledge and part of each other cultures. I was working with models to explore spacial qualities they can provide Working with the model of the gastronomic passage I was trying to shape the roof in a way that it would avoke a feeling of movement. The perception of the space changes while walking.

Exhibition pavilion

The second pavilion is intended for exhibitions. Various artists living in the city of Gothenburg will be able to present their works there. The place is sheltered and always open for the public. There is no entrance fee. The exhibiton pavilion can be transformed according to the requirements of exhibitions thanks to light, movable walls, situated on the rails.

Communities' culture center

The third pavilion is an alternative meeting place for all the associations renting the places in the culture houses all around the city. The place can be rented for free by everyone belonging to one of the associations or living in Gothenburg, and who would like to organize a cultural event or a meeting.

In the model I was trying to work with transparency and flexibility of the facade. The events carried after the dusk are more apparent due to the light coming through very slim stripes of wooden cover. The visualisation presents the situation when some parts of the structure are slightly flooded. The covering materials like wood and metal are still visible.

COMPONENTS. PARTLY FLOODED STRUCTURE

Proposal

COMPONENTS

In order to elaborately explain my components, I have chosen one pier for a detailed description of the design. To begin, the general principle of the structure are presented below. The preliminary structure consists of two huge I-beams on three sets of pillars for each beam. The secondary structure is built by three-dimensional beams made of metal. Within the structural frame the floating units are attached. Those floating units are one of the factors allowing the artificial landscape for the constant change due to environmental conditions.

The level which allow access to the next part only when the water level is low enough

Floating movable platform, adjusting to the water dynamics, always provide the access between the parts.

Biozones with flora and fauna characteristic for the wetlands.

COMPONENTS

Spatial components differ in height, breadth and its later function. However, the elements are built in a common way.

The avenue is an attractive pathway along temporary inaccessible part of the structure. It remains unaffected by the water fluctuations. That is why it can be used all year around. Fixed levels, which are low enough to be submerged makes the fluctuation more discernible. An accumulation of levels with varying height makes the water fluctuation vividly apparent. The height of them determines the frequency they are flooded.

The decision in favor of smaller and larger steps has an immediate bearing on the possible uses. The material used to cover them also influences its function. (Wood encourages stay and sit, while metal is mainly dedicated to walk on)

Fixed ramps which makes people aware of the changing water level.

The lower levels are not so exposed to the strong wind and more cozy to sit even during windy days. Floating levels are moving with the water, allowing or preventing communication between the adjacent levels. The ramps are fixed elements which by slow submergence in the water show even small changes in the water level.

The floating movable ramps are the connector between floating and fixed levels, allowing for the constant connection between those two.

The floating ramps and levels create an alternative to the avenue pathway. The biozones are located in the spots constantly facing the water. Thanks to regular floods the plants are watered. The permanently uncovered parts of the structure become ponds and enhance the experience of flowing water making the direct contact always possible.

Floating movable ramps, which gives changing points of view on the surroundings.

The main factor influencing the design of the elements is their resistance to the corrosion. The structure is made of aluminum which is getting mat and protects itself afterwards.

Some of the steps and ramps are covered by the painted steel-the others are allowed to rust and change with the time.

Not all the elements are entirely made of steel. There are also wooden parts which are changing the color with the time and humidity of the water is encouraging those processes.

This re-establishment of the riverbank allows the urban tissue for a direct interweave with the water edge.

It elevates formerly underestimated area into prominent part of the cityscape.

Ponds which are not covered part of the structure.

Proposal

SCENARIOS

I would like to present how the space at Skeppsbron can be used all year around.
In summer, people can exercise along the river, or just sunbath and dabble their feet in the water.

In autumn it is possible to seek shelter from the rain inside the building or attend lectures.
Outdoors, one can take cover from the rain under the textile roof or conduct over activities on the decks.

Scenarios during the winter include staying outdoors, for some fresh air on a winter sun. Children can build snowmen and have snowball fight.

In spring flock of birds returning from warmer parts of the globe
Fly by the pier and it is finally time to enjoy the wormer days!

I believe that my design creates inclusive environment along the river, which is attractive for people from all parts of the city. Moreover, the proposal directly corresponds to the urban conditions of the site.

Acknowledgement

I am heatily grateful for the advisors team in Urban and Architectural Design Studio: Ana Betancour, Carl-Johan Vestlund and Joaquim Tarraso, for their support, supervision, patience and motivation throughout the research. Their guidance enable me to complete this master thesis successfully.

I also would like to thank to my colleagues in the stuio for their encouragement. The discussion with people who share similar challanges helps to overcome the moments of stagnations. Thank you for your time and involment in building up a great atmosphere in the studio.

I am sincerely grateful to my parents for their love and support and for my sister for her encouragement. I owe my gratitude to my boyfriend for his patience, understanding and involvement, and to my friend Emma for her constructive advice and positive energy. Without them, my master thesis would not have been possible.

Edyta Świątek

MODELS' DESCRIPTION

Testing ideas with models was one of my methods to improve the design. Presented photographs shows the path I have taken before I have reached the final proposal.

The adjacent images present flexibility of the wooden fascade, made of very thin stripes. In order to improve elasticity and resilience the other material can be suggested: like a fiber glass or strong rubber.

The number and size of the openings in the facade can be adjusted by their users according to their needs.

The other models document the process.

The images from pages:48-49 register my analyzes about the extension of the shoreline. I was testing the spatial alternatives to the landfill (suggested by municipality).

Pages 50-53 are representing my works with pavilions: I was testing many shapes and scales.

Pages 55-56 present how I was working with one choosen stripe. I was working at the same time with structure and the pavilion to make the design coherent. Simultaneously I was testing programs with the models.
